KEYWORD INDEX

Applications 233
Ash deposition 267
Atomisation 41
Automobile 1

Burner 349

Catalysis 1
Chemical reactors 1
Coal 283
Coalescence 65
Combustion 349
Comprehensive model 267
Control 233

Droplet trajectories 303
Droplet collisions 65
Droplet size distribution 41
Droplet velocity 41
Disruption 65

Emission control 1
Emission formation 349

History 233

Laminar stagnation flows 303
Large-scale boiler 267

Modeling 267, 349

Nitrogen oxide 349
NO_x control 233

Optical measurement 41

Phase Doppler velocimeter 41
Pulverized coal 349
Pulverized-coal combustion 267
Pyrolysis 283

Slagging 267
Soot 283
Spray combustion 41, 303

SUBJECT INDEX

Absorption, radiation 141–142
ACERC *see* Advanced Combustion Engineering Research Center
Acetic acid flames, ionic composition 476
Acetylene flames
  negative ionic composition 464–467
  positive ionic composition 457–464
Advanced Combustion Engineering Research Center (ACERC) 201
  decade of contributions 203–232
  education 226–228
  future 228–229
  industrial collaboration 226–228
  research program 207–226
Aerodynamics influence, nitrogen oxide formation 361–369
Aftertreatment, catalytic automotive exhaust 1–39
Agglomerate size, soot 291–293
Air levels, nitrogen oxide reduction 370
Air pollutant emissions 214–215

Alcohol flames, ionic composition 473–475
Alternative fueled engines, catalysis 21
Alzeta Pyecore ceramic fiber burners 255, 258
Analyzers, Hot Foil Loi 262
Ash deposition
  fouling model 272
  heat flux 279, 280, 281
  large scale combustion 267–282
  modeling 267–282
  literature review 268–273
  predictive indices 268–273
  pilot-scale simulations 275–277
Ash formation 212–213
Ash transformation model (ATRAN) 268–270
Atomic spectra 148–149
Atomic structure 138–141
Atomisation, spray combustion 41–63
ATRAN *see* ash transformation model
Automobiles, exhaust aftertreatment 1–39

Back-scattered light, sizing measurements 54–57
Benzene
  flame composition 467–469
  soot yields 289
Binary water drop collisions 69–75
Block swirler 359–360
Boilers
  char oxidation 351–352
  Goudey 277, 278
  nitrogen oxide formation 369–371
  simulations 277–281
Bounce, droplets 70
Breakdown ignition system, characteristics 386–387
Broadening *see* spectral line broadening
Bulk solid sampling, soot 292–293
Burners
  air staging 370
  Alzeta Pyecore ceramic fiber 255, 258
  axial concentration profiles 243, 245
  conventional vs. low NO_x 361–362
  dual register 243, 245, 252
  flame stabilisation 512–515
  nitrogen oxide 349–377
  pulverized coal 349–377
  radian rapid mix 256, 258
  recuperative 92–93
  regenerative 93
  spray counterflow 305–306

Butadiene, soot yields 289

Rayleigh scattering 179
Reaction engineering, furnaces models 371–372
Reaction mechanisms, fuel structure 207–211
Reactions, ion-molecule 426–432, 455–457
Reburning 84–85
NO_x control 241–242, 255
Recombination rate 434–435
Recuperative burners 92–93
Regenerative burners 93

Saturated hydrocarbon flames 470–472
Scanning excitation temperature, LIF spectroscopy 190
Scattering, LIF error 178–180
SCR *see* selective catalytic reduction
Secondary air, nitrogen oxide formation 365–367
Selective catalytic reduction (SCR) system 246–247, 250, 252, 260–261
Selective non-catalytic reduction (SNCR) system 246, 257–260
Side-scattered light, sizing measurements 57–61
Sizing measurements
back-scattered light 54–57
forward-scattered light 49–53
Gaussian intensity distribution 41–63
laser beams 41–63
side-scattered light 57–61
Slagging
fuels 211–213
models 271, 272, 281
waste materials 211–213
Slip velocity, nitrogen oxide formation 367–368
SNCR *see* selective non-catalytic reduction
Solid fuel combustion 484
Soot
agglomerate size 291–293
bulk solid sampling 292–293
butadiene yields 289
coal combustion systems 283–301
coal pyrolysis data 286–290
electric field influence 515–518
entrained flow experiments 285–286
Ex situ measurements 294
experiments performed 284–286
flames 288, 441–448
fluidized bed data 286
formation 95–132, 288
electric field influence 515–518
flames 288
ions 500–508
modeling 297–298
history 496–500
hydrocarbon flames 441–448
In situ measurements 294–295
ion formation 500–508
models 99–129
detailed chemistry 119–129
empirical correlations 99–102
formation 297–298
optical constants 295–297
semi-empirical models 102–119
nitrogen content 290–291
optical experiments 291–292
optical properties 293–297
origination zone 443–445
oxidation 95–132, 297–298
particle size 291–293
pyrolysis 284–285
sampling 292–293
TEM micrograph 292
thermoionization 445–448, 489
Spark discharges, ignition systems 381–383
Spark ignition engines
see also standard spark ignition systems; supplementary secondary energy ignition
catalytic converters 7–25
flame propagation 237–238
high energy systems 379–398
operation 380–381
Spark ignition system, coil 381–382
Spark plugs
corona 386–389
fuel consumption 384–385
pressure histories 391
Spectral fitting, LIF spectroscopy 174–175
Spectral interference, LIF spectroscopy 178

Spectral line broadening 146–148
  combined Doppler and collisional broadening 148
  Doppler broadening 147–148
  natural and collisional broadening 146–147
  pressure broadening 146–147
  pressure narrowing 148
Spectroscopy *see* laser induced fluorescence (LIF) spectroscopy
Spray combustion 41–63
  counterflow burner 305–306
  counterflow di usionflames 322–326
  diagnostics 305–307
  droplet equations 307–309
  droplet trajectories 309–313
  equations 307–309, 320–322
  experiments 305–307
  flame interaction 334–335
  flow analytical solutions 308–309
  laminar stagnation flows 303–347
  impinging streams 333–340
  methanol 327–333
  stagnation flames 303–347
  strain rates 313–322
  structures 313–322, 335–338
  theoretical analysis 307–309
  two-stage flame 326–333
Spray stagnation flames 303–347
  see also spray combustion
SS *see* standard spark ignition systems
SSE *see* supplementary secondary energy ignition
Standard spark (SS) ignition systems
  see also spark ignition system; supplementary secondary energy ignition
  combustion characteristics 390
  discharge characteristics 383–384
Steady solutions 158–159
Sticking model, particles 274–275
Stoichiometry, nitrogen oxide formation 356–357
Supplementary secondary energy (SSE) ignition 383–384
Swirl
  combustion duration 384–385
  fuel consumption 384–385, 388
  nitrogen oxide formation 359–360, 365–367

Temperature measurement 189–192
  line shape temperature 192
  perfect gas law temperature 189–190
  planar imaging 194–195
  scanning excitation temperature 190
  thermally assisted temperature 191–192
  two-line temperature 190–191
Tertiary air, nitrogen oxide formation 366–367
Thermal nitrogen oxide 81–94, 352
Thermoionization, soot flames 445–448
Thermophoretic sampling, soot 291, 292
Three way catalytic converter (3WCC)
  mathematical modeling 23–24
  operational phenomena 8–10
Three-way catalytic converter (3WCC) 380
Trajectory modeling, droplets 310–311
Transient solutions 159–160
Tubes, flame propagation 511–512
Turbulence
  flame mixtures 387
  mixing model 217
  reacting flows 216–218
  two-phase 217
Two-line temperature, LIF spectroscopy 190–191
Two-stage combustion
  flames 326–333
  methanol spray 327–333

Units
  photometric 137
  radiometric 137
Utility boilers 277–281
  see also boilers

Vacuum pumping track, mass spectrometry 413–414
Vaporization
  flow analytical solutions 308–309
  PAH ions 489–490
Velocity measurement, LIF spectroscopy 193–194
Voigt profile 148
Volatile matter, coal combustion 351

Waste
  fouling 211–213
  incineration 213–216
  minerals 211–213
  slagging 211–213
  thermal treatment 215
Water droplet collisions 68–75
  aerodynamic 69–70
  coalescence e ciency70–72
  impact parameter 72–75
3WCC *see* three way catalytic converter

Printed and bound in Great Britain by BPC Wheatons Ltd, Exeter
